

# **Statistics and software resources**

Sophie Lee

## Statistics with R

R is a very powerful statistical software with a huge (very helpful!) online community. Because of this, there are lots of free resources to learn R so that you can apply the methods shown in this module.

Here are a list of free resources that are available when getting to grips with R:

- [R for data science](#): comprehensive introduction to R for data analysis, including worked examples and exercises for more practice
- [R for the rest of us](#): A stats-free introduction to R coding (they also have tons of useful tips posted on their [blog](#))
- [Introduction to R with Tidyverse](#): materials from a short course I teach going from absolute beginner to summarising, visualising and reporting data
- [Regressions with R](#): materials from my Regressions with R short course with worked examples of linear and poisson regression

## Datacamp courses

Some Datacamp courses covering R and statistics:

- [Introduction to Statistics with R](#)
- [Introduction to regressions in R](#)
- [Hypothesis testing in R](#)
- [GLMs in R](#)
- [Intermediate regression in R](#)
- [Hierarchical and mixed models in R](#): Where observations are not independent
- [GAMs in R](#): For modelling nonlinear relationships

## Statistics with Python

Python is fast becoming one of the most popular coding language and a go-to for data science. Python tends to be used more for machine learning than statistics, but can do everything we covered in the module. It is also a freely available software and has a growing number of free resources available to help learn.

- [Python for Data Analysis](#): Comprehensive ebook introducing the python language
- [Python for data science](#): Python's answer to R4DS, introduction to coding in python

## **Datacamp courses**

- [Introduction to statistics with python](#)
- [Exploratory data analysis with python](#)
- [Introduction to data science with python](#)
- [Hypothesis testing in python](#)
- [Introduction to regression with python](#)
- [Introduction to linear models with python](#)
- [GLMs with python](#)
